

Intro to Trigonometry (continued)

SOH CAH TOA

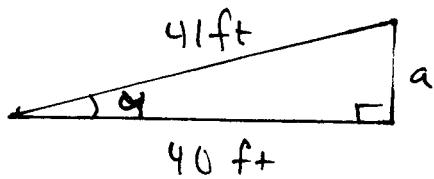

$$\sin \alpha = \frac{\text{opp}}{\text{hyp}}$$

$$\cos \alpha = \frac{\text{adj}}{\text{hyp}}$$

$$\tan \alpha = \frac{\text{opp}}{\text{adj}}$$

Warmup

(1)

what is  $a$ ?

$$a^2 + 40^2 = 41^2$$

$$a^2 + 1600 = 1681$$

$$a^2 = 1681 - 1600 \\ = 81$$

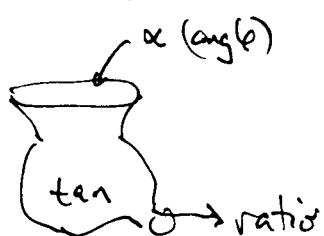

$$\boxed{a = 9}$$

what are (without a calculator)

$$\sin \alpha = \frac{\text{opp}}{\text{hyp}} = \frac{9}{41} = .220$$

$$\cos \alpha = \frac{\text{adj}}{\text{hyp}} = \frac{40}{41} \approx .976$$

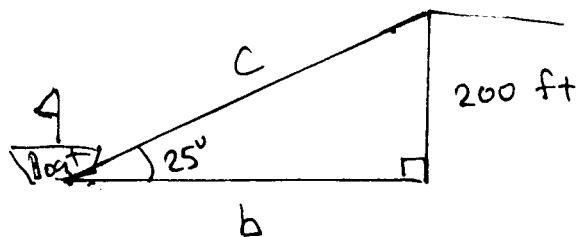

$$\tan \alpha = \frac{\text{opp}}{\text{adj}} = \frac{9}{40} = .225$$

Bonus: what is  $\alpha$  itself (the angle)?

$$\alpha = \tan^{-1}(.225) = \arctan(.225) \\ = 12.7^\circ$$

(2)

The angle of elevation from a boat to the top of a cliff is  $25^\circ$ .

a) How far is the base of the cliff from the boat?

b) How far is the top of the cliff from the boat?

$$\text{a)} \quad \tan 25^\circ = \frac{200 \text{ ft}}{b} \Rightarrow b \cdot \tan 25^\circ = 200$$

$$\Rightarrow b = \frac{200}{\tan 25^\circ} = \frac{200}{.466} = \boxed{428.9 \text{ ft}}$$

OR:  $\tan 25^\circ = \frac{200}{b}$

$$.466 = \frac{200}{b}$$

$$\text{so } b = \frac{200}{.466} = 429.2 \text{ ft}$$

↑  
more accurate

Given:

$\sin 25^\circ = .423$
$\cos 25^\circ = .906$
$\tan 25^\circ = .466$

$$\text{b)} \quad \sin 25^\circ = \frac{200 \text{ ft}}{c}$$

$$c(\sin 25^\circ) = 200$$

$$c = \frac{200}{\sin 25^\circ} \approx \frac{200}{.423} = \boxed{473.2 \text{ ft}}$$

MORE EXAMPLES: See Worksheet #5 (done in class today).
